**the Charge Berezinskii-Kosterlitz-Thouless transition in insulating TiN films«**

*Einführung: W. Wulfhekel*

---

Recently a transition from an insulating state with a sheet resistance  $\sim 1$  M $\Omega$  to a much more strongly insulating state with an unmeasurably small linear conductance was observed in strongly disordered TiN thin films [1]. It was suggested that this transition may be interpreted as the charge analog of the familiar vortex Berezinskii-Kosterlitz-Thouless (BKT) transition, resulting from a granularity within the electronic system [2]. We present new data on the linear and non-linear conductance of such films, which allow a separation of competing heating instabilities in the strongly insulating state from the non-linearities typical for the BKT transition. At very low temperatures, we observe power laws  $I \sim V^\alpha$  in the dc IV-characteristics with a strongly temperature dependent exponent  $\alpha$ , which is a hallmark of the BKT transition.
